TITLE : DISCHARGE CONTAINER

ABSTRACT : PROBLEM TO BE SOLVED: To prevent the trouble that liquid is inadvertently discharged with a container for supplying liquid to the discharge part at the front end of a container body by arranging an elastic valve made of a resin formed with a slit to be expanded by pressurizing the liquid between a liquid storage part and discharge part.

SOLUTION: The front part of the container body 1 is constituted as the liquid storage part and an advancing mechanism to be rotationally advanced by pressing a knock member is arranged in the rear part of the container body 1 in the case of embodiment to an aligner having a writing brush 8 at the front end. A holder 9 fixed with the writing brush 8 is press fitted and fixed into the aperture at the front end of the container body 1. A pipe holder 11 fixed with a pipe 10 is press fitted and fixed into the holder 9. The elastic valve 15 made of the resin is arranged between the cylindrical part 13 of the pipe holder 11 and the fringe part 14 of the container body 1. The elastic valve 15 is formed with the slit 19 in the bottom and opens the slit 19 to discharge the liquid to the pipe 10 when the liquid in the liquid storage part is pressurized by pressing the knock member.
